**ENVIZIONS
COMPUTER
ENTERTAINMENT
CORP**

[*ENVIZIONS* WHITE PAPERS]

The Envizons Computer Entertainment Corporation incorporation date is August 10, 2004; and it was made possible with seed money provided by several dedicated investors. The company management team consists of experienced marketing, innovative software development, and forward thinking entrepreneurs who share the same vision for an all in one system of tomorrow that is completely loaded with communication, entertainment, and security features. Envizons is passionately committed to providing security, communication, and entertainment solutions to consumers and is dedicated to continually improving the lives of our consumers with superior products and services. Envizons will introduce to the world the system of tomorrow, which will one day replace existing security, communication, and entertainment mechanisms that are currently in the marketplace. Envizons' motto is simple: "Envision tomorrow, Envision us. Envizons: Innovation Begins Today!"

Envizons is a customer oriented company. Our goal is to build and sustain a competitive advantage by satisfying consumer needs through efficiency, innovation, quality, and being responsive to the needs that are specified by our target market. Currently consumers need a company to combat communication deficiencies, provide a legitimate "all in one" entertainment console, bring Linux out of isolation and make it readily available to the consumer base, and provide security measures for intellectual databases for both residential and business consumers. Envizons provides several products and services that fulfill these consumer needs.

Inefficiencies in the marketplace have raised the costs for consumers by offering independent services. Consumers have separate bills for residential phone, cellular phone, internet access, television, movie rentals, and game rentals. Several services from numerous suppliers are not practical because suppliers cannot lower costs when they only specialize in one

product or service. For economical efficiency consumers need to be able to consolidate services into a single, inexpensive payment. In a sensitive economy, consolidation is the only rational option in reducing personal expenditures.

Envizons combats exaggerated spending with the arrival of the EVO Smart Console, the “System of Tomorrow.” The EVO is the most cost efficient communication, entertainment and security device. EVO is compatible with an array of services including: hardware security, software security, biometrics, gaming, development, high definition (HD), video on demand (VOD, Voice over IP telephone service (VOIP), streaming and downloadable content, internet TV, cloud computing, storage, virtualization, remote access, and many more features. The EVO Smart Console bridges the gap between PC, TV, game consoles, and other entertainment devices. Envizons is one stop shopping; consumers can choose from an array of products and services and create a custom package. Customers build their package for the EVO to fulfill their individual needs without paying for something they do not need. The “System of Tomorrow” is professional and personal, business savvy and entertaining, highly equipped and affordable. Envizons implements a low cost framework while providing top notch services. Envizons is the ultimate source for communications, entertainment and security.

Another problem facing household consumers and businesses is the complexity of emerging technology. Many professional and entertainment devices operate under a confusing operating system with an interface that is difficult to navigate. Also many operating systems are sent to market without a thorough inspection for malfunctions, users are forced to find the bugs and report them to the appropriate manufactures. This concept causes many customers to dislike the operating system and in turn be willing to find another solution to their computing needs.

Envizons created the Smart Console to be user friendly, while providing complex and highly effective programs and services. The EVO uses the Mirrors Evolution operating service, which is a Linux-based system. Mirrors Evolution is easy to navigate and a team of researchers have worked out all the kinks before going to market to ensure a quality product for users. The Linux-based system provides the ability to manage multiple operating systems within Mirrors Evolution. Mirrors Evolutions allows users to download content and have worldwide access to all of the professional and personal files. Also all file saves are secure with the use of biometrics. Consumers can use a fingerprint, facial scan, or voice recognition to save and open files easily without the use of passwords. The EVO provides ease of use by using a quality operating system that is easy for users to navigate, utilize, and secure files.

An additional problem facing consumers is how compatible technology is to their individual needs. Today consumers need safe, secure, environmentally sound devices that do not upgrade so rapidly that they cannot stay on top of the latest trends. Many devices are outdated after one month of being on the market. Technology changes so rapidly that consumers cannot afford to keep on top of all emerging technologies.

The “System of Tomorrow” is ahead of its time. The all-in-one system is competing with several industries that rapidly develop new technologies; however, technological firmware upgrades provided by Envizons are at no cost for EVO subscribers. Software, hardware, content, affiliate program, gaming, cloud computing and other EVO specific upgrades are readily available to consumers as they created by the Envizons development teams. The EVO is also an environmentally sounds device that is energy efficient and is current with the Green movement. Envizons believes low emissions make the world a better place and technology makes that

possible. Consumers can be assured that new phases of their EVO will always be obtainable and current with technological trends.

Services for the EVO Smart Console are the following:

Biometrics:

Biometrics is the use of human qualities as passwords. This includes thumb prints, facial scans, and voice recognition applications.

CD Capability:

The EVO is compatible with the use of CDs and can play through the entertainment hub.

Content Distribution:

This feature provides users to publish content for other EVO users including music, games, and other art forms.

Custom Virtualization Development Solutions:

This EVO feature allows user to run multiple operating systems within the EVO system. This is the first mainstream device to allow for this feature.

Downloading Content:

Professional, personal, and multimedia files can be downloaded from the network or the internet and saved on the hard drive or storage account for immediate or future use.

DVD Capability:

The EVO allows users to watch DVDs using the system, unlike several competing gaming systems.

DVR Capability:

Stop, rewind, pause, fast forward live TV when viewing through the EVO system.

Game Software Development Kit (SDK):

EVO is the first system to readily provide access to user development applications without the need of expansion packages for creating and developing games.

Digital Game Distribution:

Instantly download and play popular games without the inconvenience of going to a game supplier.

High Definition:

View all media content clearly through high definition including: movies, television, and games.

Internet Television:

Receive full functioning television programs through the internet with limited commercials and the ability to pause, stop, rewind, and fast forward through unwanted content.

PC:

The EVO has full functioning PC capabilities and applications via Mirrors Evolution.

Place Shifting/Remote Access:

Have the ability to access files worldwide using this feature. Be able to download professional and personal files from the Envizons server onto any PC from any location.

Social Networking:

Integrated EVO accounts within the Envizons server. Receive upgrades and stream content from a local branch instead of one over used pathway to one server.

Storage:

Safely backup files to the Envizons server and safe hard drive space for other files.

Streaming Content:

Receive temporary files for immediate use instead of having to use hard drive space. For example immediately view a movie and it will be discarded after use without have to be save to the hard drive.

Subscription Software Services:

Two software packages are provided by the Envizons Server: Household and Business. The Household Consumer Package includes: game expansion applications, services, and support. Business Packages include: support, hardware, and upgrades.

Super Cloud Computing:

Convenient convergences of applications are readily available from a master server.

Video on Demand (VOD):

Instantly watch movies without the inconvenience of going to a movie distributor.

Voice over Internet Protocol (VoIP):

Receive unlimited local and long distance calling through the EVO internet portal with unlimited minutes to talk to friends, family, and business associates.

Wireless Technology:

EVO is readily available to travel to any television with full EVO capabilities.

Envizons is the ultimate source for communications, entertainment, and security. The EVO is the “System of Tomorrow,” providing a cost efficient, user friendly, and technologically advanced services for consumers. Envizons is a technologically driven and pioneering company with the main objective to innovate and serve. The company aims to stay in forefront of technology while maintaining low costs and high user satisfaction to preserve customers and build brand loyalty. Envizons is passionately committed to providing security, communication, and entertainment solutions to consumers and is dedicated to continually improving the lives of our consumers with superior products and services.
